2 Exercises

2.1 Exercise 1.13

Do the problem 1.13 (Network architecture) from the previous weeks assignment. This time use MATLAB or Python's (sympy) symbolic toolbox. Finally assume the network presented in fig P1.13 is a binary-classifier, please depict how the input space (\mathbb{R}^2) is classified on a 2D graph using different colors.

This exercise was solved in matlab. The input-output mapping can be made for a network with structure $2 - 2 - \dots - 2 - 1$ with different weights and squashing functions: linear, sigmoid. Output layer also can have heaviside squashing function.

The network itself has a following structure:

Here is the code of the hidden layer output implementation.

```

1 function [ out ] = hiddenlayer( input , weights , squash_type )
2
3 if strcmp(squash_type , 'sigmoid')
4     squash = @(v) exp(v)./(1+exp(v));
5 else
6     squash = @(v) v;
7 end
8 out = [squash(dot(weights(1:2),input)),squash(dot(weights(3:4) ,
9         input))] ;
10 end

```

The output layer.

```

1 function [ out ] = outputlayer( input , weights , squash_type )
2
3 if strcmp(squash_type , 'sigmoid')
4     squash = @(v) exp(v)./(1+exp(v));
5 else
6     squash = @(v) v;
7 end
8 if strcmp(squash_type , 'heaviside')
9     squash = @(v) heaviside(v);
10 end
11 out = squash(dot(weights ,input));

```

```

12
13 end

Mapping calculation and plotting.

2.2 Exercise 4

Derive the Delta rule for two ADALINE neural networks depicted in Fig. 2, Fig. 3.
Solution:

1 neural network.

Input: $\vec{x} = (x_0, x_1, x_2)$, where $x_0 = 1$

Weights: $\vec{w} = (w_0, w_1, w_2)$

Figure 2: Neural network 1.

Output: $y = \vec{x}\vec{w} = w_0 + x_1w_1 + x_2w_2$

$e = d - y = d - (w_0 + x_1w_1 + x_2w_2)$, where d is a desired value.

$$E(w) = \frac{1}{2}e^2$$

Each i^{th} weight with an should be moved in the direction $\frac{\partial E}{\partial w_i}$:

$$\frac{\partial E}{\partial w_i} = x_i(d - (w_0 + x_1w_1 + x_2w_2))$$

So, each step will change each weight by the following value:

$$\Delta w_i = \eta x_i(d - (w_0 + x_1w_1 + x_2w_2)),$$

where η is a learning rate that should be chosen according to the specific of the certain case. It can be either a constant (0.5, 1, etc.) or variable, or adaptive.

Therefore the delta rule will take the following form:

$$w_i^{new} = w_i^{old} + \eta x_i(d - (w_0 + x_1w_1 + x_2w_2))$$

Neural network 2.

Figure 3: Neural network 2.

Input: $\vec{x} = (x_1, x_2)$

Weights: $\vec{w} = (w_1, w_2)$, $\vec{v} = (v_1, v_2)$, $\vec{u} = (u_1, u_2)$

Activation function is linear, so:

Output: $y = u_1(x_1w_1 + x_2v_1) + u_2(x_1w_2 + x_2v_2)$

$$e = d - y = d - (u_1(x_1w_1 + x_2v_1) + u_2(x_1w_2 + x_2v_2)).$$

Each i^{th} weight with an should be moved in the direction $\frac{\partial E}{\partial weight_i}$:

$$\frac{\partial E}{\partial v_i} = x_1 u_i (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$

$$\frac{\partial E}{\partial w_i} = x_2 u_i (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$

$$\frac{\partial E}{\partial u_i} = (x_1 w_i + x_2 v_i) (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$

So, each step will change each weight by the following value:

$$\Delta w_i = \eta_w x_1 u_i (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2))),$$

$$\Delta v_i = \eta_v x_2 u_i (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$

$$\Delta u_i = \eta_u (x_1 w_i + x_2 v_i) (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$

Therefore the delta rule will take the following form:

$$w_i^{new} = w_i^{old} + \eta x_i (d - (w_0 + x_1 w_1 + x_2 w_2))$$

$$v_i^{new} = v_i^{old} + \eta v_i x_2 u_i (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$

$$u_i^{new} = u_i^{old} + \eta u_i (x_1 w_i + x_2 v_i) (d - (u_1(x_1 w_1 + x_2 v_1) + u_2(x_1 w_2 + x_2 v_2)))$$
